                                                                                                                                      The present invention provides alpha-1,3/4-fucosyltransferase (also termed as fucosyltransferase) proteins and nucleic acids from various strains of Helicobacter pylori. This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polymucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     297

                                                                                                                                                                                                                                                                                                                                                              The invention relates a purified transmembrane segment-free alpha 1.3-

fucosyltransferase polypeptide, having a repeat of the sequence: X_1-X_2-

fucusyltransferase polypeptide, having a repeat of the sequence: X_1-X_2-

Leu-Axgrx 3.x 4.Tyr, where X 1, X_2 and X 4 is Asp or Asn; and X 3 is

11e, Val Or Ala. Also included are the nucleic acid encoding the protein

(including its complement or fragment), a vector containing the nucleic

acid, a host cell modified with the nucleic aspects

contacting transmembrane segment-free alphal, 3- fucosyltransferase,

comparising a host cell modified with the nucleic acid or its

producing fucosylated oligosaccharides, such as Lax, Ley or SLex, by

contacting the protein with a substrate such as Lax, Ley or SLex, by

contacting the protein with a substrate, to produce oligosaccharides

and purifying the obtained oligosaccharides, or by culturing the cell,

contacting the host cell with a substrate, to produce oligosaccharides

and purifying the obtained oligosaccharides. The nucleic acid is useful

a probe for detecting the nucleic acid, by contacting a sample with a

nucleic acid probe that hybridises to alphal,3-fucosyltransferase

a probe for detecting hybridisation of the probe; or by

amplitying the nucleic acid using polymerase chain reaction (PCR). The

host cell is useful for producing a transmembrane segment-free alphal,3-

cup peptide under conditions which allow expression and secretion of the

cor peptide under conditions which allow expression and secretion of the

cor peptide under conditions which allow expression and secretion in the

sample is indicative of infection by Helicobacter pylori or the presence

of mailgnant cells. The antibody is also useful as

for detecting the protein in a sample. The presence of the protein in the

sample is indicative of infection by Helicobacter pylori or the presence

of mailgnant cells. The antibody is also useful as

fucosyltransferase gene product activity. The nucleic acid is useful

fucosyltransferase can and for ti

```
fucosyltransferase is unaffected by the siallyation status of the acceptor sugar, as opposed to the mammalian homologue, and furthermore, bacterially expressed enzymes offer a large cost saving relative to mammalian expression systems. This polypeptide sequence is an H. pylori strain 1182 FutB protein sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel isolated polynucleotides and the encoded polypeptides thereof, which are related to the fucosyltransferase enzymes (Puth and Puth) of Helicobacter pylori (H. pylori). Specifically, it refers to alpha 1-3/4 fucosyltransferase enzymes that can be used to chemically synthesise glycoproteins and glycolipids with the desired oligoaccharide moleties (i.e. by transfer of a fucose residue to N-acetylglucosamine), such that they are useful in the preparation of glycoconjugates. The present invention describes how bacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  117
                                  This sequence represents an alpha-1,3/4-fucosyltransferase protein which was used in the method of the invention for producing a fucosylated glycoprotein. The method involves contacting a recombinant fucosyltransferase protein with a mixture comprising a donor substrate which comprises a fucosyl residue, and an acceptor substrate on a glycoprotein, under conditions such that the fucosyltransferase protein catalyzes the transfer of the fucose residue from a donor substrate to the acceptor substrate to the glycoprotein. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           375 NNLRADYNNLRADYNNLRADYDRLLQNRSPLLELSQNTTFKIYHKAYHKSLPLLRAIRRW

This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polymucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.

The invention relates a purified transmembrane segment-free alpha 1,3-
fucusyltransferase polypeptide, having a repeat of the sequence: X1-X2-
leu-Argy-X = X4-Ty, where X1, X2 and X4 is Asp or Asn; and X-3 is
leu-Argy-X and or Ala. Also included are the nucleic acid encoding the protein

(including its complement or fragment), a vector containing the mucleic
acid, a host call containing nucleic acid or vector, an antibody which
comprising a host cell modified with the nucleic acid or its
comprising a host cell modified with the nucleic acid or its
comprising a host cell modified with the nucleic acid or its
comprising the protein with a substrate such as LackNc-R and GDP-fucose,
contacting the protein with a substrate, to produce oligopaccharides
contacting the protein with a substrate, to produce oligopaccharides
contacting the protein with a substrate, to produce oligopaccharides
contacting the protein with a substrate, to produce oligopaccharides
contacting the protein with a substrate, to produce oligopaccharides
and purifying the obtained oligosaccharides. The nucleic acid is useful
contacting the botained oligosaccharides. The nucleic acid is useful
as a probe for detecting the nucleic acid using polymerse chain reaction (PCR). The
polymucleotide, and detecting phyridisation of the probe; or by
contacting the nucleic acid using polymerse chain reaction (PCR). The
host cell is useful for producing a transmembrane segment-free alphal, 3-
cucleic acid using polymerse chain reaction (PCR). The
host cell is useful for producing a transmembrane segment-free alphal, 3-
corpopulate under conditions which allow expression and secretion of the
cuspiltransferase-fusion protein, by growing the host cell containing a
cucleic acid using the fusion protein. The antibody is useful
cor peptide under conditions which allow expression and secretion of the
corporation of isolating the fusion protein. The antibody is useful
and monitoring disease, and for inhibiting abnormal alphal,3-
cof malignant cells are useful in the pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mammalian tunnours. The present sequence represents an H. pylori alphal,3 fucosyltransferase encdoed by the fucT gene. (Updated on 29-AUG-2003 to

VPI; 2002-582480/62 Ge Z; Taylor DE,

Purified transmembrane segment-free alphal, 3-fucosyltransferase polypeptide useful for producing fucosylated oligosaccharides.

3xample 3; Fig 6; 37pp; English.

C The invention relates a puritied transmembrane segment-tree alpha 1.3-c fucosyltransferase polypeptide, having a repeat of the sequence: X 1-X 2 c fucosyltransferase polypeptide, having a repeat of the sequence: X 1-X 2 c leu-Arg-X 3-X 4-Tyr, where X 1, X 2 and X 4 is Asp or Asn; and X 3 is 1.4 x 1.5 including its complement or fragment), a vector containing the nucleic coid, a host cell containing nucleic acid or vector, an antibody which selectively binds to the protein and agene expression system for producing transmembrane segment-free alphal, 3- fucosyltransferase, comprising a host cell modified with the nucleic acid or its contacting the protein with a substrate such as lack, by contacting the protein with a substrate such as lack, by contacting the protein with a substrate, to produce oligosaccharides, or by culturing the cell, contacting the protein with a substrate, to produce oligosaccharides, or by culturing the cell, contacting the protein with a substrate, to produce oligosaccharides, or by contacting the bost cell with a substrate, to produce oligosaccharides, and purifying the obtained oligosaccharides. The nucleic acid is useful as a probe for detecting the nucleic acid using polymerse chain reaction (PCR). The polymelectide, and detecting phynidisation of the probe; or by colymelectide, and detecting phynidisation of the probe; or by colymelectide, and detecting phynidisation of the probe; or by colymelectide, and detecting phynidisation of the probe; or by cortor operably linked to a polymerse chain reaction (PCR). The cost cell is useful for producing a transmembrane segment. Free alphal, 3- fucosyltransferase-fusion protein, by growing the host cell containing a condition protein and isolating the fusion protein. The antibody is also useful for detecting the protein in a sample. The nucleic acid is useful for conditions which allow expression and for alphal, 3- fucosyltransferase gene product activity. The nucleic acid is an any poduce of maingnant cells. The antibody is also useful for d invention relates a purified transmembrane segment-free alpha 1,3standardise OS field)

Sequence 476 AA;

```

```
production of fucosylated oligosaccharides such as Lewis X, Lewis Y and sialyl Lewis X, which are structurally similar to certain tumour associated antigens found in mammalla. These glycoconjugates also have research and diagnosis utility in the development of assays to detect antibodies. Inhibition of abnormal fucr gene product activity can be used for the treatment of intestinal mucosal disease. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                ų,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                                                                                                                                7
                                                                                                                                                     This invention relates to novel isolated polynucleotides and the encoded polypeptides thereof, which are related to the fucosyltransferase enzymes (Futh and FutB) of Helicobacter pylori (H. pylori). Specifically, it refers to alpha 1-3/4 fucosyltransferase enzymes that can be used to chemically synthesise glycoproteins and glycolipids with the desired oligosaccharide moieties (i.e. by transfer of a fucose residue to Nacctylglucosamine), such that they are useful in the preparation of glycoconjugates. The present invention describes how bacterial fucosyltransferase is unaffected by the sialyation status of the acceptor sugar, as opposed to the mammalian homologue, and furthermore, bacterially expression systems. This polypeptide sequence is an H. pylori strain 1111 FutA protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      238

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an alpha-1,3/4-fucosyltransferase protein which was used in the method of the invention for producing a fucosylated glycoptorein. The method involves contacting a recombinant fucosyltransferase protein with a mixture comprising a donor substrate which comprises a fucosyl residue, and an acceptor substrate on a glycoprotein, under conditions such that the fucosyltransferase protein catalyzes the transfer of the fucosy residue from a donor substrate the acceptor substrate on the producing fucosylated glycoprotein. The method is useful for producing fucosylated glycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides alpha-1,3/4-fucosyltransferase (also termed as fucosyltransferase) proteins and nucleic acids from various strains of Helicobacter pylori. This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polymucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          440

Sequence 1, Application US/09733524A

Patent No. 6534298

GENERAL INPORMATION:

APPLICANT: Taylor, Diane E.

APPLICANT: Taylor, Diane E.

TITLE OF INVENTION: NUCLEIC ACIDS ENCODING ALPHA-1,3

TITLE OF INVENTION: EXPRESSING THEM (amended)

TITLE OF INVENTION: EXPRESSING THEM (amended)

FILE REFERENCE: 07254-049002

CURRENT APPLICATION NUMBER: US/09/733,524A

CURRENT FILING DATE: 1998-06-05

PRIOR FILING DATE: 1998-06-05

PRIOR FILING DATE: 1997-06-06

NUMBER OF SEQ ID NOS: 27

SOOFWARE: PASLSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ONPNEPSDLVFGSPIGAARKILSYONTKRVFYAGENEVPNFNLFDYAIGFDELDLRDRYL 117
